
Magento 2 manual installation

Unfortunately the Magento 2 plugin can't be installed completely via the back end of your webshop. Instead, you will need to use an FTP tool to upload the files manually.

1. Enable Magento Cache found in System > Cache Management.
2. Extract the Magento 2 ZIP-file and upload the app folder to the root directory of the Magento installation using your FTP client. All folders should match the existing folder structure.
3. Run the following command in the terminal and enter user password:

```
ssh username@domain.com
```

4. Change your current directory to Magento 2 web root directory running this command:

```
cd /full_path_to_magento2
```

5. Start the setup of the Hreflang extension by running this command:

```
php bin/magento module:enable EMS_Payment  
php bin/magento setup:upgrade  
php bin/magento setup:static-content:deploy
```

6. Now you've entered the right commands into the SSH client the extension will be installed and deployed.
7. It can take a few minutes until all the files are successfully transferred and deployed in your Magento 2 Store.
8. Navigate to Stores > Configuration > EMS > Payment to configure and use the extension.
